Pink Mixture: doz. 75c

Red Mixture: doz. 75c

White Mixture: doz. 75c

Mixed Salmon Tints: doz. 75c

Assorted Primulinus Varieties: doz. 75c

CULTURE OF GLADIOLI.

Gladiolus will grow and bloom in almost any kind of soil but I find a fairly heavy soil with a little sand is most suitable. Soil should be worked 10 inches deep and well rotted mature compost may be added if needed. When the soil is heavily manured to produce large flowers, they are produced at the expense of the bulbs and such bulbs may decay in storage or be weaker growers next season. Bulbs may be planted from 3 to 6 inches deep according to the nature of the soil and size of the bulb. They may be planted in rows 18 inches or more apart, the bulbs 4 to 6 inches apart in the rows.

In California the first plantings may be made from January to March and if a succession of bloom is desired throughout the season they should be planted every two weeks after March first. They take from 90 to 120 days to bloom. Cultivate often and do not allow the ground to bake. Gladiolus like moisture especially during the flower forming and blooming period. When the first bud has opened the spike may be cut leaving at least four leaves to continue the development of the bulb and bulblets.
